

MIDRIS in Maryland

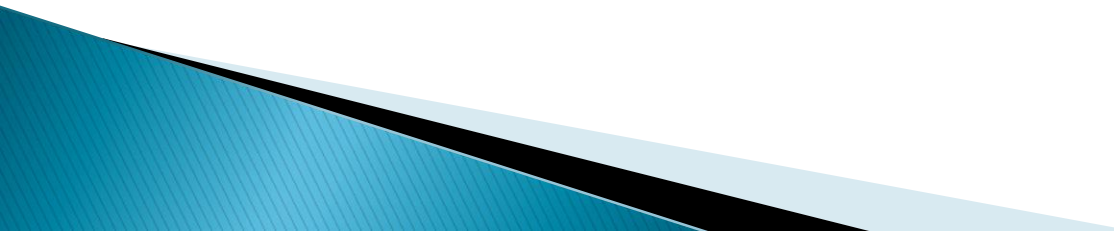

Issues

- ▶ MIDRIS is a prime example of “one size does not fit all.”
 - Some states may start from scratch.
 - Some states may elect to integrate existing systems.
 - Some states may build a central data warehouse containing everyone’s data.
 - Some states may set up pointer systems with data retained in the owner systems.
- 

Implementation Issues / Challenges

- ▶ MIDRIS is a prime example of “one size does not fit all.”
 - A very few states will have everything found in MIDRIS.
 - Most states will start with what they have and then look toward improving & expanding over time.

Issues

- ▶ To effectively implement MIDRIS in a state there must be:
 - A champion
 - A commitment by data owners to share their data
 - Top level commitment to the effort
 - A realistic set of expectations, timelines and budget estimate...
 - Constant, open communications between stakeholders
- 

Implementation in Your State – Where to Start?

Start by taking inventory of existing systems in your state.

- What systems are involved?
- Who owns the systems?
- What data elements are in these systems?
- What are the sharing/privacy issues?
- What agency will be the likely holder of the impaired driver system?

Moving forward

How do we get everyone on board and make this effort a priority?

- ▶ Discuss how it will benefit each stakeholder.
- ▶ Dual systems
 - Dashboard
 - Warehouse
